1) Which tasks have been completed?

   So far, I've completed the initial logic for creating preforming the sentiment analysis on music titles. I've used Python and NLTK and created an app with the reddit api to scan r/music to get an understanding of user's feelings towards certain music titles.

2) Which tasks are pending?

   The tasks that are still pending are to create a basic UI to give the user something to interface with and type in songs/artists or album titles. The other piece is to finish debugging my code, I still have some issues where it runs indefinitely and some other times where the code errors out. Since I'm still getting familiar with these packages and apis it will just take some time to debug.

3) Are you facing any challenges?

   The only challenges I've faced so far is changing to scope of my project just a bit, in order to better fit what I want to accomplish in this project I'm now letting the user search for anything (music) to do a sentiment analysis. Before I wanted to scan for just new releases, but I felt this change made the project more accomplishable in the amount of time I had.
